This list is a first attempt to document the herpetofaunal assemblage found in Piedras Blancas National Park, which is located in the southwestern Pacific zone of Costa Rica.

We defined an area which is outlined by the Esquinas river and the Carretera Interamericana in the north and the Carretera 14 from Rio Claro to Golfito in the east, including the coastal waters of the Golfo Dulce between the mouth of the Rio Esquinas and Golfito. This area covers the reserves of the Parque Nacional Piedras Blancas and the Refugio Nacional de Fauna Silvestre Golfito, as well as unprotected buffer zones of agricultural areas located south of the Interamericana and west

secondary data from literature (i.e. Gallmetzer & Schulze 2015), other researchers, visitors, and residents (currently amounting to 1.100+ georeferenced species records).

Data for the Piedras Blancas area was obtained from literature and are mainly based on the distribution maps of Savage (2002), with additions from Kubicki (2007) and Bessesen (2010, 2011).

The currently known herpetofaunal assemblage of this area comprises 123 species, 86 of them recorded from La Gamba.

of the Carretera 14.

Our field work was focused in the area surrounding La Gamba Tropical Station (operated by the University of Vienna, [www.lagamba.univie.ac.at](http://www.lagamba.univie.ac.at)), which included the trail system of the Esquinas Lodge and the association 'Rainforest of the Austrians' (3.4 km<sup>2</sup>).

The resulting list is mainly based on our surveys from 2011-2015, but also includes reliable
